Top-Ten of microplastic emissions, Germany Total: 330.000 t/a; 4.000 g /(c a)

	Source	"Umsicht"- Report	Min.	max	Urban Water Managemen
1	Tyre wear	1,228.5	49.6	1,357	
2	Release from waste disposal	302.8	-	-	++
3	Abrasion bitumen in asphaltos	228			
4	Pellet losses	182	0,5	2,567.2	++
5	Drifts from plastic sports fields	131.8	-	-	+-
6	Release from construction sites	117.1			+-
7	Abrasion from shoe soles	109	17.5	175.4	
8	Abrasion from plastic packaging	99.1	-	-	
9	Abrasion from road markings	91	19.3	121.1	
10	Abrasion from textiles during laundry	76.8	-	-	++
13	Flocculants in urban water management	42.5	-	-	++
17	Microplastics from cosmetics	19.0	1.6	11.0

berlin

Possible measures - TYRES

- Eliminating the highest abrasion performing tyres
 - test method + emission limiting value
- Labelling TWP emission according to the energy label
- Disclose tyre composition
- Extended Producer Responsibility (EPR) for tyre manufacturers (modulated fees)
- Alternative tyre materials
- Extending tyre lifetime
- Monitoring tyre emissions in the environment by adding a tracing material to the tyres

EU Study: Cost-benefit analysis of policy measures reducing unintentional release of microplastics, 2022

Measures to reduce the input of tire material into the environment Tackling microplastics in the environment, Brussels, 09/03/2023

Possible measures - VEHICLE

- Artificial intelligence and advanced driver assistance systems in vehicles to reduce abrasion
 - Promoting autonomous driving
- Acceleration and speed limitation in urban areas
- Enhance the monitoring of tyre pressure to reduce emission (not only focused on driver safety)
- Reducing vehicle weight
- Install capture device to collect tyre particles (Passenger / Trucks)
- Continuous axis alignment in vehicle design and maintenance (Tracking)

EU Study: Cost-benefit analysis of policy measures reducing unintentional release of microplastics, 2022

Further possible measures

ROAD

Abrasion rate criteria to be added to road design requirements (e.g., roundabouts) & road material characteristics (porous asphalt / rubber asphalt)

• SUSTAINABLE MOBILITY

- Awareness campaigns
- Speed limits (motorway / urban area)
- Improve traffic management
- Reduction automotive individual traffic
- Mileage / Road transport reduction
- Promote bicycle traffic

EU Study: Cost-benefit analysis of policy measures reducing unintentional release of microplastics, 2022

Measures to reduce the input of tire material into the environment Tackling microplastics in the environment, Brussels, 09/03/2023

- Improve capture and treat road run-off water
 (e.g., Filter systems at Hot- Spot for gullies)
- Improve road cleaning in high emission hotspots (Intelligent network)
- Retention soil filters
- Sludge treatment
- Additional field research

Emissions by Wastewater Treatment plant

Measures to reduce the input of tire material into the environment Tackling microplastics in the environment, Brussels, 09/03/2023

Results of Wastewater treatment plants

- High retention of microplastics in conventional treatment plants (> 99 %)
- Further reduction by advanced filtration (> 99,9 %)
- Future focus on combined sewer overflows and road runoff

Measures to reduce the input of tire material into the environment Tackling microplastics in the environment, Brussels, 09/03/2023

berlin

Summary and Outlook

- Microplastic sampling is very complex
 - New methods of sample taking were developed
- Sampling and analytics is not standardised

 - TGA/GCMS
 Mass of particles and material
- Road run off and stormwater overflows \rightarrow important impact
- Reduction of tyre wear emission for example:
 - Labelling TWP emission, alternative tyre materials
 - Speed and acceleration limitation in urban areas
 - Promote public transport and bicycle traffic
 - Treatment at emission hotspots, Improve road cleaning
- Wastewater treatment plants (WTP)
 - Microplastic removal >> 95% 99%
 - Effluents of WTP have a minor impact on MP emission
- Are regulations necessary?
